

Managed Hosting Vs Shared Web Hosting

When it comes to choosing a best web hosting option, numerous choices are available to the end users. Amongst them, shared web hosting is the most reputed form of web hosting and is the best for most of the websites. However, in case of websites experiencing problems with the high traffic, or users especially concerned with the sensitive information and website security, managed web hosting is the best option.

Shared Web Hosting: It would be disastrous for users having smaller websites to shell out their hard earned savings in purchasing a server. Worse still is the expenditure or the leasing of a dedicated server. The most cheap and efficient web hosting solution is Shared web hosting. Shared Web hosting involves the sharing of multiple websites on a single hosting server. Web host servers are both powerful and large, and contain enough bandwidth capacity and room which helps in the hosting of multiple websites easily. When the user chooses the option of shared web hosting, the user also subscribes for a web hosting package from the respective firm, which contains a specific number of bandwidth and space on the server. This helps the website owners to take complete benefit of a mighty web hosting server, by not paying more than the actual need.

Managed Web Hosting: On many occasions, it so happens that the servers used by customers deal with highly confidential information and have to deal with heavy traffic. Such servers are more suitable for managed web hosting as compared to shared web hosting. In case of a dedicated web hosting, the website never shares the server of the user with any other website. As a matter of fact, the web hosting server is specifically devoted to the website of the user. Majority of the firms, who are in need of the essential services of a dedicated web hosting server embark on managed web hosting for their solutions. This is for the fact that, both the actual administration as well as the management of a devoted host consumes a lot of time. In case, the owner of the website chooses a hosting option which is unmanageable, the user of the server who is essentially its owner has to take the responsibility with regards to the maintenance of the web hosting server. It is a fact that taking care of a web host consumes a lot of time. In addition, it comprises everything from security issues to day to day maintenance.
